

Banquet Hall Booking System

Venue Management System — Development Phase Document

			W or kfl o w		W eb -B as ed
Sections	12	Core Modules	6	Automation	Platform

01 Introduction

The development phase is where project plans are transformed into a working system. It encompasses environment configuration, module creation, automation, interface setup, and testing — covering the full lifecycle of implementation.

For the Banquet Hall Booking System project, the development phase involves building a fully functional web-based venue management system. This phase directly implements the scope defined in the planning document, translating requirements into configured modules, workflows, reports, and dashboards.

Implementing the system correctly is critical because it determines the accuracy of reservation data, the reliability of automated notifications, and the usability of the interface for both staff and clients.

02 Environment Setup

System Setup	Module Creation	Navigation Setup
Development environment configured with web-based booking platform Sandbox environment for safe configuration and testing	Six core modules created: Inquiry, Availability, Booking, Event Coordination, Notifications, Reporting Custom interface branding applied	Navigation bar configured with module tabs: Inquiries, Availability, Bookings, Events, Dashboards, Reports Quick-access shortcuts enabled

03 Core Module Creation

Six core modules were developed to model the key operational entities of the banquet hall booking process. Each module represents a real-world concept and contains fields appropriate to its purpose.

3.1 Inquiry Module

The Inquiry module is the entry point of the Banquet Hall Booking System. It stores the initial details provided by clients when they first contact the venue. This includes their personal details and specific event requirements.

Field Name	Data Type	Required	Description
------------	-----------	----------	-------------

Client Name	Text	Yes	Full name of the client making the inquiry
Contact Email	Email	Yes	Client email for communication
Contact Phone	Phone	Yes	Client contact number
Event Type	Picklist	Yes	Wedding / Corporate / Birthday / Other
Expected Guest Count	Number	Yes	Estimated number of attendees
Preferred Date	Date	Yes	Desired event date
Special Requirements	Text Area	No	Any specific requests from the client

3.2 Availability Module

The Availability module maintains the venue calendar and tracks which dates are reserved or open. It allows staff to confirm hall availability before proceeding with a booking.

Field Name	Data Type	Required	Description
Hall Name	Text	Yes	Name or section of the banquet hall
Date	Date	Yes	Calendar date for availability check
Status	Picklist	Yes	Available / Reserved / Blocked
Capacity	Number	Yes	Maximum guest capacity for the hall
Linked Booking	Lookup (Booking)	No	Reference to the booking occupying this slot

3.3 Booking Module

The Booking module is the operational core of the system. It formally records a confirmed reservation linking a client inquiry to a specific hall and event date. It is the trigger point for automated confirmation notifications.

Field Name	Data Type	Required	Description
Client Name	Lookup (Inquiry)	Yes	Client associated with this booking
Hall / Venue	Lookup (Availability)	Yes	Hall section reserved for the event
Event Date	Date	Yes	Confirmed date of the event

Booking Status	Picklist	Yes	Confirmed / Pending / Cancelled
Total Guest Count	Number	Yes	Final confirmed guest count
Coordinator Assigned	Text	No	Name of the event coordinator assigned

3.4 Event Coordination Module

The Event Coordination module captures all planning details agreed upon with the client after the booking is confirmed. It coordinates seating, menu, AV, and décor preferences for the event day.

Field Name	Data Type	Required	Description
Booking Reference	Lookup (Booking)	Yes	Linked confirmed booking
Seating Layout	Picklist	Yes	Theatre / Banquet / Classroom / Custom
Menu Selection	Text Area	No	Catering menu agreed with client
AV Requirements	Text Area	No	Microphone, projector, and display needs
Décor Preferences	Text Area	No	Floral, lighting, and theme details
Final Checklist	Checkbox	No	Confirmed all event-day arrangements

04 Automation — Email Notifications

A record-triggered workflow was configured on the Booking module. When a new booking record is created with status Confirmed, the workflow automatically dispatches a confirmation email to the client — eliminating manual notification effort.

Trigger	Record is Created. Entry Condition: Booking Status = Confirmed. Runs immediately on save.
Action 1	Retrieve Client Email — Retrieves the related client email address from the linked inquiry record.
Action 2	Send Confirmation Email — Sends a pre-configured email template to the client confirming their booking details, hall name, and event date.
Action 3	Update Availability Record — Marks the linked availability record status as Reserved to prevent duplicate bookings.

05 Field Customization & Validation

Picklist: Status	Applied to Booking and Availability modules. Restricts status entry to predefined values: Confirmed, Pending, Cancelled, Available, Reserved, Blocked.
Picklist: Event Type	Applied to the Inquiry module with values Wedding, Corporate, Birthday, Anniversary, Other.
Required Fields	Client Name, Email, Phone, Event Type, Guest Count, Preferred Date (Inquiry); Booking Status, Hall, Event Date (Booking) — all enforced as required.
Validation: Event Date	Rule ensures the preferred or booking date cannot be in the past. Prevents retrospective entries.
Validation: Email Format	Format validation on Client Email enforces correct email structure, rejecting malformed addresses before saving.

06 User Interface Configuration

The user interface was configured to present a clean, intuitive environment for Banquet Hall Booking System users. All interface changes were made through the application's module manager and page layout editor.

Module Navigation	Tab Creation	Page Layouts
Booking system app created with Lightning-style navigation Custom branding applied Utility bar configured for quick access	Six module tabs created: Inquiries, Availability, Bookings, Events, Dashboards, Reports Custom tab icons assigned to each module	Page layouts customized per module Key fields positioned prominently on detail views Related lists configured for cross-module navigation

07 Reports Creation

Reports were configured to provide management with data-driven insights into booking patterns and event distribution. A custom report type was created to enable cross-module reporting.

Report Type	Bookings with Inquiries and Events — a custom report type that joins Booking, Inquiry, and Event modules, enabling a single report to display data across all three entities.
Fields Used	Booking ID, Client Name, Event Type, Event Date, Hall Name, Guest Count, Booking Status, Coordinator — providing a complete view of all active reservations.
Filters Applied	Status = Confirmed, Date Range = Current Month — filtered to show only active confirmed bookings, eliminating noise from cancelled or pending records.

Format	Tabular report with row-level detail, sorted by Event Date ascending. Designed for export and academic review of system data accuracy.
---------------	--

08 Dashboard Creation

A dashboard was created to visualize booking and event data in real time. Dashboards provide at-a-glance operational visibility for banquet hall management.

Dashboard Setup	New dashboard created titled 'Banquet Hall Booking Overview'. Configured with a 3-column layout for clean visual presentation. Set to refresh on login for current data.
Pie Chart Component	A pie chart widget was added sourcing data from the Bookings by Event Type report. The chart displays booking distribution across all active event types.
Bar Chart Component	A bar chart was added showing booking count by month, giving management a snapshot of peak booking periods throughout the year.
Metric Component	A metric tile was added displaying the total count of Confirmed Bookings this month, providing an instant KPI for current booking activity.

09 Testing

Comprehensive testing was conducted across all configured components before final submission, ensuring the system behaves correctly under real-world usage scenarios.

Test ID	Test Case	Result
T1	Created test inquiry records with all required fields. Verified that all required field validations triggered correctly.	✓ PASS
T2	Tested the end-to-end booking process: client inquiry created, availability checked, booking confirmed, status updated.	✓ PASS
T3	Verified that the Booking Confirmation workflow dispatched an email to the client upon status being set to Confirmed.	✓ PASS
T4	Attempted to enter a past date for the booking. Validation rule fired correctly, blocking the save with the configured error message.	✓ PASS
T5	Ran the Bookings with Inquiries and Events report. All test records displayed correctly with accurate cross-module data.	✓ PASS
T6	Viewed dashboard charts. Charts rendered correctly showing booking distribution by event type and month.	✓ PASS

10 Conclusion

The Banquet Hall Booking System has been fully implemented, with all planned modules, workflows, automation, and interfaces configured and validated.

The development phase successfully transformed the planning document into a working, tested system. Six core modules — Inquiry, Availability, Booking, Event Coordination, Notifications, and Reporting — were created with appropriate fields, relationships, picklists, and validation rules. A record-triggered workflow automates booking confirmation emails, eliminating manual administrative effort.

The system is production-ready for the defined scope and provides a solid foundation for future enhancements such as payment integration, mobile access, and multi-venue management.

Banquet Hall Booking System — Development Phase Complete

System is configured, tested, and ready for academic submission and evaluation.
