

Banquet Hall Booking System

PHASE 1 — REQUIREMENT ANALYSIS & PLANNING

01 Introduction

The Requirement Analysis and Planning phase focuses on understanding business needs, identifying system requirements, and defining the overall project scope. This phase ensures that the developed Banquet Hall Booking System aligns with the real-world operations of a venue management business and delivers maximum value to all users.

Purpose: This phase acts as the blueprint for the entire Banquet Hall Booking System development — aligning technology with real business needs.

02 Understanding Business Requirements

The primary goal of the Banquet Hall Booking System is to simplify and automate the daily operations of a venue booking facility.

Key Business Needs

Efficient management of reservation data	Easy availability checking and booking system
Automated notifications and confirmation emails	Tracking event schedules and client requirements
Generating reports for decision-making	Coordinating event-day activities and staff

Problems to Solve

Manual errors in reservation handling	Difficulty in managing availability across dates
Lack of automated client communication	No centralized booking system exists

03 Functional Requirements

These define what the system must do — the core capabilities delivered to every user.

F1	Capture, update, and manage client inquiry and booking records
F2	Manage venue availability and display real-time scheduling calendar

F3	Generate and issue booking confirmations to clients automatically
F4	Allow clients to specify event requirements including guest count, layout, menu, and AV needs
F5	Automate email notifications for booking confirmations and reminders
F6	Coordinate event-day details and support on-site staff management

04 Non-Functional Requirements

These define the quality, performance, and operational standards the system must meet.

Attribute	Requirement
Performance	Handles multiple concurrent booking inquiries efficiently without degradation
Security	Data protected with role-based access control and field-level security
Scalability	Architecture supports growth in booking volumes and venue locations
Usability	Clean, intuitive interface requiring minimal training for staff and clients
Reliability	High uptime with cloud infrastructure guarantees for continuous availability

05 Project Scope & Objectives

In Scope	Out of Scope
• Inquiry and reservation management • Availability and scheduling system • Booking confirmation automation • Client communication and notifications • Event coordination and planning support	• Payment gateway integration (future enhancement) • Mobile application development • Multi-venue franchise management • Third-party calendar sync (future phase)

Objectives

01	Automate banquet hall booking operations end-to-end
02	Reduce manual workload and eliminate data errors
03	Improve operational efficiency and client communication accuracy
04	Provide real-time scheduling insights and availability management

06 Data Model Design

The high-level data model defines the core entities and their relationships in the booking system.

Entity	Relationship	Description
Client	One Client → Many Bookings	A single client may place multiple booking inquiries
Booking	One Booking → One Event	Each confirmed booking is linked to a specific event date and hall
Event	One Event → Many Requirements	An event captures layout, guest count, menu, and AV needs
Hall / Venue	One Hall → Many Bookings	A hall has a calendar of bookings and is unavailable when reserved

07 Security Model Design

Goal: Ensure every user can access only the data relevant to their role — nothing more, nothing less.

Role-Based Access	Admin, Coordinator, and Client roles — control data access at each level
Field-Level Security	Sensitive client and payment fields hidden from unauthorized roles
Record-Level Access	Clients can only view their own bookings and event details
Audit Logging	All booking modifications tracked with user timestamp records

08 Stakeholder Mapping

Venue Owner System Admin & Decision Maker	Event Coordinator Manages bookings and client sessions	Clients Inquire, book, and track events	Admin Staff Manage data and daily operations
--	---	--	---

09 Execution Roadmap

A structured six-step plan guiding the Banquet Hall Booking System from concept to delivery:

01	Requirement Analysis — Gather and document all business and system needs
02	System Design — Design process flows, data model, and architecture
03	System Configuration — Setup booking modules, fields, and relationships
04	Interface Development — Build client-facing and admin-facing interfaces
05	Testing — Unit testing, UAT, and end-to-end validation
06	Documentation — Final reports, user guides, and handover package

10 Conclusion

The Requirement Analysis and Planning phase provides a clear understanding of the business needs and system expectations. It acts as a blueprint for the development of the Banquet Hall Booking System, ensuring that all functionalities are aligned with real-world requirements and deliver efficient, scalable solutions.

With clearly defined functional and non-functional requirements, a robust data model, a layered security design, and a six-step roadmap, the Banquet Hall Booking System is positioned for structured, successful delivery.

Next Phase: System Design & Configuration

The outputs of this phase — data model, security model, and roadmap — feed directly into system setup, interface design, and workflow configuration.
